Get our environment set up

The first thing we'll need to do is load in the libraries and dataset we'll be using. We'll be working with a dataset containing information on earthquakes that occured between 1965 and 2016.

We have gathered this dataset from the publicly available domain Kaggle. We have used the �Significant Earthquakes, 1965-2016� dataset from Kaggle in the CSV format. It includes a record of the date, time, location, depth, magnitude, and source of every earthquake with a reported magnitude 5.5 or higher since 1965.

```python
# modules we'll use
import pandas as pd
import numpy as np
import seaborn as sns
import datetime

# read in our data
earthquakes = pd.read_csv("../input/earthquake-database/database.csv")

# set seed for reproducibility
np.random.seed(0)
```

[2] Python

1) Check the data type of our date column

We are working with the "Date" column from the `earthquakes` dataframe. We investigate this column now and see if it looks like it contains dates and what the dtype of the column is.

```python
# TODO: Your code here!
earthquakes['Date'].head()
```

[3] Python

```
0    01/02/1965
1    01/04/1965
2    01/05/1965
3    01/08/1965
4    01/09/1965
Name: Date, dtype: object
```

2) Convert our date columns to datetime

Most of the entries in the "Date" column follow the same format: "month/day/four-digit year". However, the entry at index 3378 follows a completely different pattern. We run the code cell below to see this.

+ Code + Markdown

```
earthquakes[3378:3383]
```

[6] Python

	Date	Time	Latitude	Longitude	Type	Depth	Depth Error	Depth Seismic Stations	Magnitude	Magnitude Type	...	Magnitude Seismic Stations	Azimuthal Gap	Horizontal Distance	Horizontal Error	Root Mean Square	ID	Source	Location Source	Magnitude Source
3378	1975-02-23T02:58:41.000Z	1975-02-23T02:58:41.000Z	8.017	124.075	Earthquake	623.0	NaN	NaN	5.6	MB	...	NaN	NaN	NaN	NaN	NaN	USP0000A09	US	US	US
3379	02/23/1975	03:53:36	-21.727	-71.356	Earthquake	33.0	NaN	NaN	5.6	MB	...	NaN	NaN	NaN	NaN	NaN	USP0000A0A	US	US	US
3380	02/23/1975	07:34:11	-10.879	166.667	Earthquake	33.0	NaN	NaN	5.5	MS	...	NaN	NaN	NaN	NaN	NaN	USP0000A0C	US	US	US
3381	02/25/1975	05:20:05	-7.388	149.798	Earthquake	33.0	NaN	NaN	5.5	MB	...	NaN	NaN	NaN	NaN	NaN	USP0000A12	US	US	US
3382	02/26/1975	04:48:55	85.047	97.969	Earthquake	33.0	NaN	NaN	5.6	MS	...	NaN	NaN	NaN	NaN	NaN	USP0000A1H	US	US	US

5 rows � 21 columns

This does appear to be an issue with data entry: ideally, all entries in the column have the same format. We can get an idea of how widespread this issue is by checking the length of each entry in the "Date" column.

```
date_lengths = earthquakes.Date.str.len()
date_lengths.value_counts()
```

[7] Python

```
10    23409
24        3
Name: Date, dtype: int64
```

Looks like there are two more rows that has a date in a different format. We Run the code cell below to obtain the indices corresponding to those rows and print the data.

```
indices = np.where([date_lengths == 24])[1]
print('Indices with corrupted data:', indices)
earthquakes.loc[indices]
```

Go Live

[8]

```
Indices with corrupted data: [ 3378  7512 20650]
```

	Date	Time	Latitude	Longitude	Type	Depth	Depth Error	Depth Seismic Stations	Magnitude	Magnitude Type	...	Magnitude Seismic Stations	Azimuthal Gap	Horizontal Distance	Horizontal Error	Root Mean Square	ID	Source	Location Source	Magnitu Sour
3378	1975-02-23T02:58:41.000Z	1975-02-23T02:58:41.000Z	8.017	124.075	Earthquake	623.0	NaN	NaN	5.6	MB	...	NaN	NaN	NaN	NaN	NaN	USP0000A09	US	US	I
7512	1985-04-28T02:53:41.530Z	1985-04-28T02:53:41.530Z	-32.998	-71.766	Earthquake	33.0	NaN	NaN	5.6	MW	...	NaN	NaN	NaN	NaN	1.30	USP0002E81	US	US	HI
20650	2011-03-13T02:23:34.520Z	2011-03-13T02:23:34.520Z	36.344	142.344	Earthquake	10.1	13.9	289.0	5.8	MWC	...	NaN	32.3	NaN	NaN	1.06	USP000HWQP	US	US	GCN

3 rows � 21 columns

Given all of this information, we create a new column "date_parsed" in the `earthquakes` dataset that has correctly parsed dates in it.

We have now converted all the date columns into datetime.

```python
# TODO: Your code here
earthquakes.loc[3378, "Date"] = "02/23/1975"
earthquakes.loc[7512, "Date"] = "04/28/1985"
earthquakes.loc[20650, "Date"] = "03/13/2011"
earthquakes['date_parsed'] = pd.to_datetime(earthquakes['Date'], format="%m/%d/%Y")
```

Python

3) Select the day of the month

Create a Pandas Series `day_of_month_earthquakes` containing the day of the month from the "date_parsed" column.

```python
# try to get the day of the month from the date column
day_of_month_earthquakes = earthquakes['date_parsed'].dt.day
```

Python

4) Plot the day of the month to check the date parsing

Plot the days of the month from your earthquake dataset.

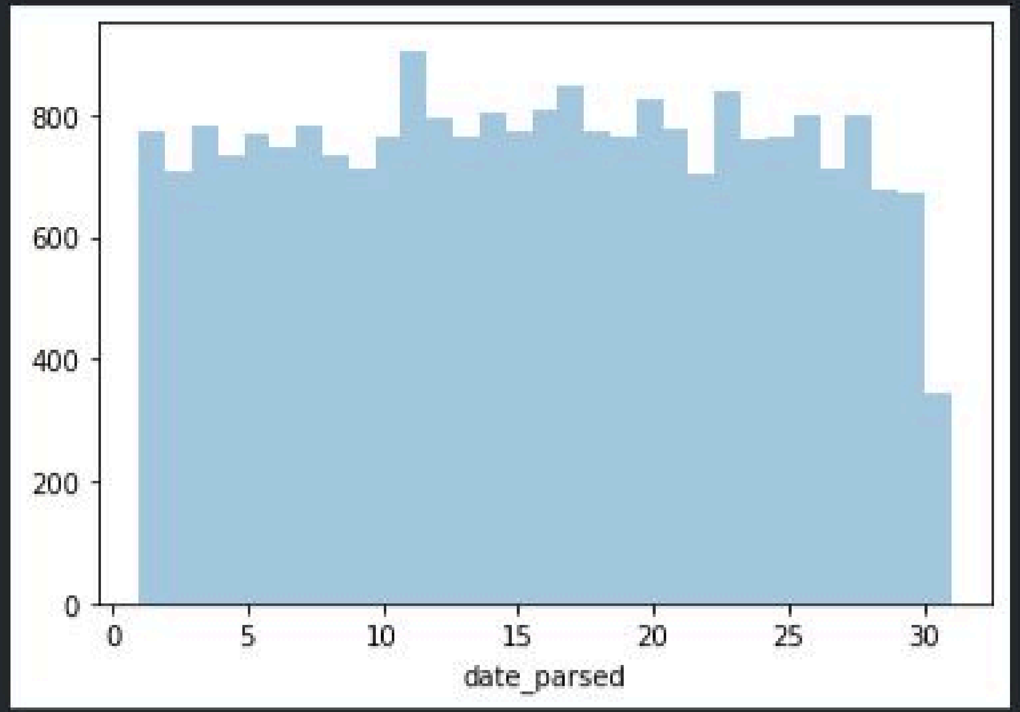
```python
# TODO: Your code here!
# remove na's
day_of_month_earthquakes = day_of_month_earthquakes.dropna()

# plot the day of the month
sns.distplot(day_of_month_earthquakes, kde=False, bins=31)
```

[13] Python

```
/opt/conda/lib/python3.7/site-packages/seaborn/distributions.py:2619: FutureWarning: `distplot` is a deprecated function and will be removed in a future version. Please adapt your code to use either `displot` (a
  warnings.warn(msg, FutureWarning)
```

```
<AxesSubplot:xlabel='date_parsed'>
```



Now we have visualized a graph that shows the days of the month. This data parsing is just for visualizing the data. When training, we import and use the dataset as it is.

Import Libraries and Dataset

Here we import the other neccessary libraries for further data visualization and import the dataset as well

Import the necessary libraries required for buidling the model and data analysis of the earthquakes.

```python
import matplotlib.pyplot as plt

import os
print(os.listdir("../input"))
```

[5] Python

```
['database.csv']
```

Read the data from csv and also columns which are necessary for the model and the column which needs to be predicted.

```python
data = pd.read_csv("../input/database.csv")
data.head()
```

[6] Python

	Date	Time	Latitude	Longitude	Type	Depth	Depth Error	Depth Seismic Stations	Magnitude	Magnitude Type	Magnitude Error	Magnitude Seismic Stations	Azimuthal Gap	Horizontal Distance	Horizontal Error	Root Mean Square	ID	Source	Location Source	Magnitude Source	
0	01/02/1965	13:44:18	19.246	145.616	Earthquake	131.6	NaN	NaN	6.0	MW	NaN	NaN	NaN	NaN	NaN	NaN	ISCGEM860706	ISCGEM	ISCGEM	ISCGEM	Aut

4	01/09/1965	13:32:50	11.938	126.427	Earthquake	15.0	NaN	NaN	5.8	MW	NaN	NaN	NaN	NaN	NaN	NaN	ISCGEM860890	ISCGEM	ISCGEM	ISCGEM	Aut

```python
data.columns
```

[7] Python

```
Index(['Date', 'Time', 'Latitude', 'Longitude', 'Type', 'Depth', 'Depth Error',
       'Depth Seismic Stations', 'Magnitude', 'Magnitude Type',
       'Magnitude Error', 'Magnitude Seismic Stations', 'Azimuthal Gap',
       'Horizontal Distance', 'Horizontal Error', 'Root Mean Square', 'ID',
       'Source', 'Location Source', 'Magnitude Source', 'Status'],
```

```
    dtype='object')
```

Figure out the main features from earthquake data and create a object of that features, namely, Date, Time, Latitude, Longitude, Depth, Magnitude.

```
data = data[['Date', 'Time', 'Latitude', 'Longitude', 'Depth', 'Magnitude']]
data.head()
```

Python

	Date	Time	Latitude	Longitude	Depth	Magnitude
0	01/02/1965	13:44:18	19.246	145.616	131.6	6.0
1	01/04/1965	11:29:49	1.863	127.352	80.0	5.8
2	01/05/1965	18:05:58	-20.579	-173.972	20.0	6.2
3	01/08/1965	18:49:43	-59.076	-23.557	15.0	5.8
4	01/09/1965	13:32:50	11.938	126.427	15.0	5.8

Here, the data is random we need to scale according to inputs to the model. In this, we convert given Date and Time to Unix time which is in seconds and a numeral. This can be easily used as input for the network we built.

+ Code + Markdown

```
import datetime
import time

timestamp = []
for d, t in zip(data['Date'], data['Time']):
    try:
        ts = datetime.datetime.strptime(d+' '+t, '%m/%d/%Y %H:%M:%S')
        timestamp.append(time.mktime(ts.timetuple()))
    except ValueError:
        # print('ValueError')
        timestamp.append('ValueError')
```

Python

```
timeStamp = pd.Series(timestamp)
data['Timestamp'] = timeStamp.values
```

Python

```
final_data = data.drop(['Date', 'Time'], axis=1)
final_data = final_data[final_data.Timestamp != 'ValueError']
```

Go Live

```python
final_data = data.drop(['Date', 'Time'], axis=1)
final_data = final_data[final_data.Timestamp != 'ValueError']
final_data.head()
```

[11] Python

	Latitude	Longitude	Depth	Magnitude	Timestamp
0	19.246	145.616	131.6	6.0	-1.57631e+08

4	11.938	126.427	15.0	5.8	-1.57026e+08

Visualization

Here, all the earthquakes from the database in visualized on to the world map which shows clear representation of the locations where frequency of the earthquake will be more.

```python
from mpl_toolkits.basemap import Basemap

m = Basemap(projection='mill',llcrnrlat=-80,urcrnrlat=80, llcrnrlon=-180,urcrnrlon=180,lat_ts=20,resolution='c')

longitudes = data["Longitude"].tolist()
latitudes = data["Latitude"].tolist()
#m = Basemap(width=12000000,height=9000000,projection='lcc',
            #resolution=None,lat_1=80.,lat_2=55,lat_0=80,lon_0=-107.)
x,y = m(longitudes,latitudes)
```

[12] Python

```python
fig = plt.figure(figsize=(12,10))
plt.title("All affected areas")
m.plot(x, y, "o", markersize = 2, color = 'blue')
m.drawcoastlines()
m.fillcontinents(color='coral',lake_color='aqua')
m.drawmapboundary()
m.drawcountries()
plt.show()
```

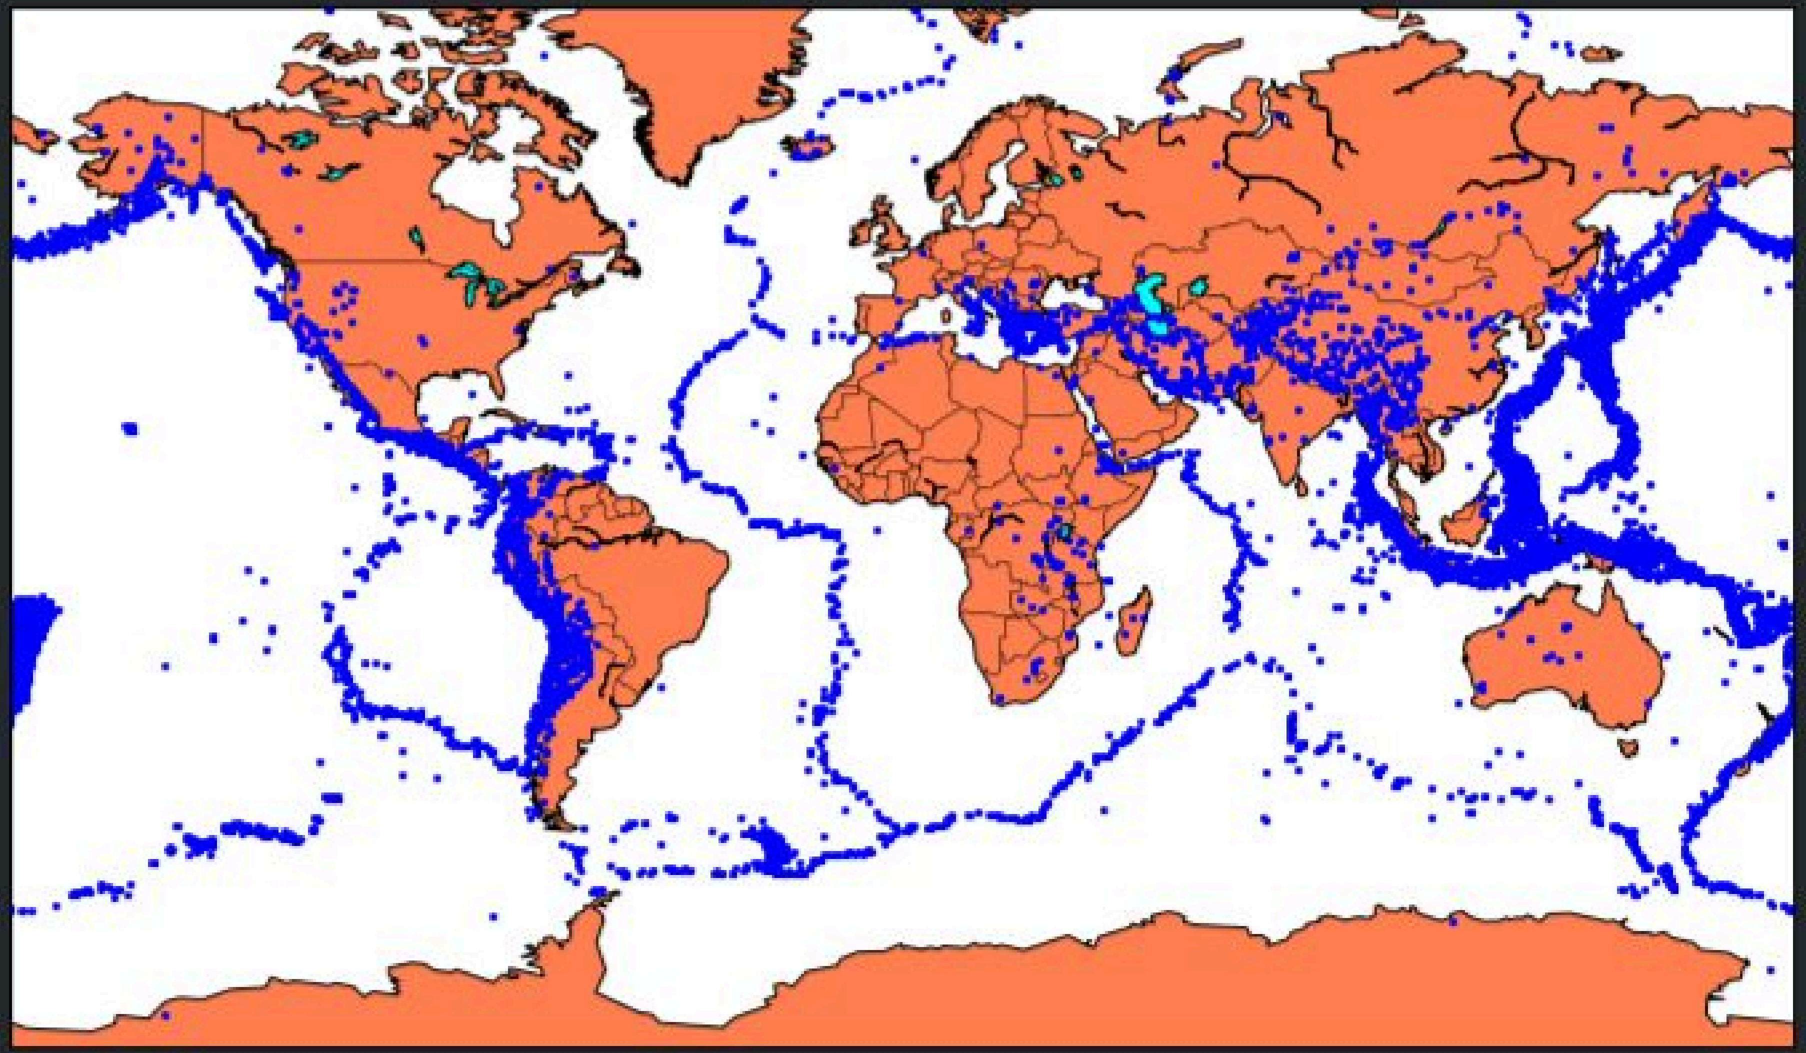
  if limb is not ax.axesPatch:
```

All affected areas



Splitting the Data

Firstly, split the data into Xs and ys which are input to the model and output of the model respectively. Here, inputs are TImestamp, Latitude and Longitude and outputs are Magnitude and Depth. Split the Xs and ys into train and test with validation. Training dataset contains 80% and Test dataset contains 20%.

```python
X = final_data[['Timestamp', 'Latitude', 'Longitude']]
y = final_data[['Magnitude', 'Depth']]
```

[14] Python

```python
from sklearn.cross_validation import train_test_split

X_train, X_test, y_train, y_test = train_test_split(X, y, test_size=0.2, random_state=42)
print(X_train.shape, X_test.shape, y_train.shape, X_test.shape)
```

[15] Python

```

[19] Python

```
0.8749008584467053
```

Building the Neural Network model

In the above case it was more kind of linear regressor where the predicted values are not as expected. So, Now, we build the neural network to fit the data for training set. Neural Network consists of three Dense layer with each 16, 16, 2 nodes and relu, relu and softmax as activation function.

```python
from keras.models import Sequential
from keras.layers import Dense

def create_model(neurons, activation, optimizer, loss):
    model = Sequential()
    model.add(Dense(neurons, activation=activation, input_shape=(3,)))
    model.add(Dense(neurons, activation=activation))
    model.add(Dense(2, activation='softmax'))

    model.compile(optimizer=optimizer, loss=loss, metrics=['accuracy'])

    return model
```

[20] Python

```
Using TensorFlow backend.
```

In this, we define the hyperparameters with two or more options to find the best fit.

Go Live

In this, we define the hyperparameters with two or more options to find the best fit.

```python
from keras.wrappers.scikit_learn import KerasClassifier

model = KerasClassifier(build_fn=create_model, verbose=0)

# neurons = [16, 64, 128, 256]
neurons = [16]
# batch_size = [10, 20, 50, 100]
batch_size = [10]
epochs = [10]
# activation = ['relu', 'tanh', 'sigmoid', 'hard_sigmoid', 'linear', 'exponential']
activation = ['sigmoid', 'relu']
# optimizer = ['SGD', 'RMSprop', 'Adagrad', 'Adadelta', 'Adam', 'Adamax', 'Nadam']
optimizer = ['SGD', 'Adadelta']
loss = ['squared_hinge']

param_grid = dict(neurons=neurons, batch_size=batch_size, epochs=epochs, activation=activation, optimizer=optimizer, loss=loss)
```

[21] Python

Here, we find the best fit of the above model and get the mean test score and standard deviation of the best fit model.

```python
grid = GridSearchCV(estimator=model, param_grid=param_grid, n_jobs=-1)
grid_result = grid.fit(X_train, y_train)

print("Best: %f using %s" % (grid_result.best_score_, grid_result.best_params_))
means = grid_result.cv_results_['mean_test_score']
stds = grid_result.cv_results_['std_test_score']
params = grid_result.cv_results_['params']
for mean, stdev, param in zip(means, stds, params):
    print("%f (%f) with: %r" % (mean, stdev, param))
```

[22] Python

```
Best: 1.000000 using {'activation': 'relu', 'batch_size': 10, 'epochs': 10, 'loss': 'squared_hinge', 'neurons': 16, 'optimizer': 'Adadelta'}
0.936562 (0.000858) with: {'activation': 'sigmoid', 'batch_size': 10, 'epochs': 10, 'loss': 'squared_hinge', 'neurons': 16, 'optimizer': 'SGD'}
0.000000 (0.000000) with: {'activation': 'sigmoid', 'batch_size': 10, 'epochs': 10, 'loss': 'squared_hinge', 'neurons': 16, 'optimizer': 'Adadelta'}
0.646286 (0.411324) with: {'activation': 'relu', 'batch_size': 10, 'epochs': 10, 'loss': 'squared_hinge', 'neurons': 16, 'optimizer': 'SGD'}
1.000000 (0.000000) with: {'activation': 'relu', 'batch_size': 10, 'epochs': 10, 'loss': 'squared_hinge', 'neurons': 16, 'optimizer': 'Adadelta'}
```

The best fit parameters are used for same model to compute the score with training data and testing data.

```python
model = Sequential()
model.add(Dense(16, activation='relu', input_shape=(3,)))
model.add(Dense(16, activation='relu'))
model.add(Dense(2, activation='softmax'))

model.compile(optimizer='SGD', loss='squared_hinge', metrics=['accuracy'])
```

[23] Python

```python
model.fit(X_train, y_train, batch_size=10, epochs=20, verbose=1, validation_data=(X_test, y_test))
```

[24] Python

```python
[test_loss, test_acc] = model.evaluate(X_test, y_test)
print("Evaluation result on Test Data : Loss = {}, accuracy = {}".format(test_loss, test_acc))
```

[25] Python

```
4682/4682 [==============================] - 0s 22us/step
Evaluation result on Test Data : Loss = 0.5, accuracy = 0.018581802648440837
```

We see that the above model performs better but it also has lot of noise (loss) which can be neglected for prediction and use it for furthur prediction.

The above model is saved for furthur prediction that could be done with a user interface.

```python
model.save('earthquake.h5')
```

[26] Python
